BREAK
SEED
IN
HULLING**

Efficient Hulling and Scarifying

This huller is so constructed it will positively not break seed when properly operated. The seed is rubbed against a heavy rubber outer chamber by the inside cylinder. This rubber action will hull the toughest kind of seed without any damage to the seeds. We recommend this machine for hulling such seed as sweet clover, alfalfa, lespedeza, burr clover and many other small seeds requiring hulling and scarifying. It can also dewhisker caraway, dill and carrot seed. Can also be used in hulling barley, oats, millet, speltz when necessary. Two types of hulling cylinders are built for this huller. One is made with steel surface and one with rubber surface. We recommend the rubber cylinder for lespedeza seed as this seed is very easily broken.

The mechanical construction will permit the operator to have any speed or closeness of hulling that he may desire instantly, by simply turning an adjusting screw to the desired position.

Will be found especially useful for crushing clay lumps in alfalfa and clover seed without injury to the seed.

Ball bearing throughout. Requires a 5-horsepower MOTOR, V-BELT SPEED CHANGING DRIVE, FLOOR SPACE, 3 x 4 feet.

All our machines warranted for one year for defects in material and workmanship and to give satisfactory service.
